

BRIEF 05

Particles vs. Endocrine Chemicals

Related subjects, different evidence bases

PRIMARY-SOURCE REVIEW IN PROGRESS

Microplastic particles and plastic-associated chemicals such as BPA and phthalates are connected topics, but they are not the same exposure and should not be presented as one evidence category.

WHAT THE CURRENT MATERIAL SUPPORTS

- The endocrine system coordinates growth, metabolism, reproduction, sleep, mood, and energy through hormone signaling.
- BPA, phthalates, and other endocrine-disrupting chemicals have been studied for decades and have a broader evidence base than microplastic particles.
- Researchers are investigating whether particles may carry chemicals or contribute through inflammation or oxidative stress.

WHAT IT DOES NOT ESTABLISH

- Chemical evidence cannot automatically be attributed to the physical particle itself.
- The supplied draft's individual hormone and metabolic claims need a complete primary bibliography before production approval.
- The material does not establish an individual diagnosis or treatment recommendation.

INTERVIEW-SAFE LANGUAGE	Use separate sentences for particle evidence and chemical evidence. Name which exposure the study actually measured.
SOURCE STATUS	Source-review briefing grounded in Dr. Haddad's supplied draft: Endocrine.pdf.
